### Schlüsselwörter

Boxcryptor Cryptomator Datensicherheit Verschlüsselung

### Lösung (öffentlich)

#### Preparation

If you have a fully encrypted Boxcryptor folder as shown in the following screenshot, follow the instructions below for the "Migration of existing data." Full encryption is ensured when all subfolders and files contained in the folder display the green symbol.

Screenshot Boxcryptor: Fully encrypted folder

Cryptomator encrypts all files that are located within the folder selected for encryption. Mixed encryption, which Boxcryptor could provide, is not possible using Cryptomator. If you have a mixed encrypted Boxcryptor folder consisting of encrypted and unencrypted subfolders and files (see screenshot below), you can either encrypt all the files with Cryptomator (full encryption) or continue to encrypt only the currently encrypted files, in which case you only need to copy these to the new Cryptomator folder.

Screenshot Boxcryptor: Mixed encrypted folder

Migration of existing data

-

Select your files from the Boxcryptor drive and copy them to your new Cryptomator drive, for example using drag and drop. Important: Please pay attention to the amount of data to be copied. For large amounts of data, make sure you copy file by file or folder by folder.

Screenshot of Windows Explorer: Window with marker on start and destination folder for copy process

-

After completing this step, check the readability of your data in the new Cryptomator safe.

For more information, please refer to the [1]Migration Guide from Boxcryptor.

Make sure that no sensitive data is stored unencrypted in the cloud at any time. Alternatives for storing sensitive data can be found [2]in the linked FAQ article.
