OWA Setup E-Mail Client Android Kalender iOS

Lösung (öffentlich)

Feature Overview

Email ✓

Encryption -

Calendar ✓

In this guide, you will learn how to log in to the Outlook Web App to access a TU Dresden email inbox. You can then send and receive unencrypted emails and view your calendar.

Note: Encrypted emails cannot be read in the web interface. To retrieve encrypted emails, an [1]email client must be set up and then the personal certificate must be stored.

Login
- Open Outlook Web App (OWA) at [2]msx.tu-dresden.de.
- If you have already logged in to a TU Dresden service today, the mailbox will be displayed directly.
Otherwise, log in using Single Sign On (SSO) via Shibboleth.
[3]You can find help on logging in here.

Calendar usage on mobile devices

If you do not want to set up a mail client via the Exchange protocol, OWA is a good choice as a calendar app due to its full support. During installation, an icon is created on the home screen which displays the OWA website without the usual web browser menus.

Android
- Start the Chrome browser, go to [4]msx.tu-dresden.de and log in as described above.
- To get the calendar view when starting the app, select the calendar icon in the lower menu bar.
- Call up the Chrome menu by selecting the three-dot button.
- Select the "Add to Home screen" entry.
- If necessary, assign an individual name for the shortcut and confirm with "Add".
- Confirm the process with "Add to home screen".
- The app now appears as an icon on the home screen.

iOS
- Start the Safari browser, go to [5]msx.tu-dresden.de and log in as described above.
- To get the calendar view when starting the app, select the calendar icon in the lower menu bar.
- Call up the Share menu by selecting the Share button.
- Select the "To home screen" entry.
- Assign an individual name for the link if necessary and confirm the process with "Add".
- The app now appears as an icon on the home screen.

Troubleshooting Note to users with private Windows devices

If you cannot access the OWA website due to a security warning ("phishing" etc.), this may be due to the "security software" you are using. Configure this accordingly or use the "Windows Defender" already integrated in Windows, for example.
